Automated Business Workflow using Deluge Scripting — Vehicle Service Request Form

INDHUMATHY K

Register Number: 241401030

1. Aim

To design and implement an automated business process workflow within the Zoho Creator application using Deluge scripting, and to successfully conduct application testing and debugging to verify real-time execution, using the Vehicle Service Request form.

Objectives

- To configure a form-level event trigger that automatically executes actions upon a successful record creation for the Vehicle Service Request form.
- To write custom backend logic using Deluge syntax to send automated email confirmations to the customer once their service request is accepted.
- To perform end-to-end debugging and live testing to ensure data accuracy and workflow reliability.

2. Procedure

Step 1: Initiating the Workflow Configuration

1. Open the Vehicle Service Request application in Edit mode.
2. Select Workflows from the left-hand navigation panel.
3. Click on the Create New Workflow button to open the automation setup window.

Step 2: Defining the Trigger Parameters

1. Under the Choose form dropdown, select the target form: Vehicle Service Request.
2. For the Record Event condition, select Created to ensure the automation runs only when a brand-new service request entry is submitted.
3. For the Form Event condition, select Successful form submission to trigger the backend actions right after validation.
4. Name the workflow clearly as "Send registration email" and click Create Workflow.

Run workflow on any event in the form

Choose form Vehicle Service Request

Run when a record is (Record Event) ☒ Created ☐ Edited ☐ Created or Edited ☐ Deleted

When to trigger workflow (Form Event) Successful form submission

Name the workflow Send registration email

[Create Workflow](#)

The workflow setup window shows the Vehicle Service Request form selected, the Record Event set to Created, the Form Event set to Successful form submission, and the workflow named Send registration email, ready to be created with the Create Workflow button.

Step 3: Setting up the Action Interface

1. Inside the newly created workflow diagram block, click the Add New Action button.
2. Select Deluge script from the available option panels to launch the cloud-based Deluge code editor workspace.

The Add New Action panel shows the four available action types — Notification, Data access, Integrations, and Deluge script — with the action configured to run Always.

Step 4: Developing the Deluge Script

1. Write the backend code inside the editor using Zoho's proprietary Deluge syntax.
2. Fetch the current Vehicle Service Request record using its ID, and validate that the customer's email field is not blank before proceeding.
3. Implement a sendmail function block using the system variable `zoho.adminuserid` as the sender, and the customer's email field as the recipient.

4. Define strict parameter pairs within the bracket block, ensuring correct spacing for tags (from:, to:, subject, message:).

The Deluge Script editor for the Send registration email workflow, showing the record fetch, email validation, and sendmail block that emails the customer once their Vehicle Service Request is accepted.

The finalised Deluge script used in this workflow is reproduced below:

```
// Fetch the current record to get user email
vehicleServiceRequest = Vehicle_Service_Request1[ID == input.ID];
// Validate that email field exists and is not blank
if(vehicleServiceRequest.email.isBlank())
{
    info "Email address is missing for this request";
}
else
{
    // Prepare email notification
    sendmail
    [
        from :zoho.adminuserid
        to :vehicleServiceRequest.email
        subject :\"Your Vehicle Service Request is Accepted\"
        message :\"<p>Dear Customer,</p><p>Your vehicle service request has been
accepted. We will contact you shortly to schedule the service.</p><p>Thank you for
choosing our services.</p>\"
    ]
}
```

Step 5: Compiling and Saving

1. Review the code to eliminate syntax errors, mismatched brackets, or missing string quotation marks.
2. Click the blue Update button in the lower right corner to compile the code and successfully push the workflow script live.

Step 6: Executing Live Application Testing

1. Switch the application from the editor environment to the live User View.
2. Open the live Vehicle Service Request form.
3. Populate all fields — Owner Name, Email Address, Phone Number, Pickup Address, Vehicle Registration Number, Service Type, Issue Description, Preferred Date, Odometer Reading, and Vehicle Type — with mock data and a valid, accessible test email address.
4. Click the form's Submit button.

Vehicle Service Request

Owner Name *
First Name Last Name

Email Address

Phone Number

Pickup Address *
Address Line 1

Address Line 2

City / District State / Province

Postal Code Country

Vehicle Registration Number *

Service Type ☒ Oil Change
☐ Tire Rotation
☐ Brake Repair
☐ Engine Diagnostics
☐ Full Service
☐ Other

Issue Description

Additional Services

Preferred Date

Odometer Reading

Vehicle Type

Preferred drop off time

Authorization checkbox
☐ Choice 1
☐ Choice 2
☒ Choice 3

The live Vehicle Service Request form populated with test data, including owner details, pickup address, service type (Oil Change), odometer reading, and the authorization checkbox, ready for submission.

Step 7: Validation and Debugging Analysis

1. Verify the initial browser response to confirm the record was successfully added to the database.
2. Log into the target email client inbox.
3. Check the primary inbox to confirm that the automated email with the subject line "Your Vehicle Service Request is Accepted" arrived successfully without system delay.

The Gmail inbox showing the automated notification email from the Vehicle Service Request workflow at the top of the list.

3. Output

The delivered confirmation email — subject "Your Vehicle Service Request is Accepted" — sent from `notifications@trial.zohocreatormail.com`, confirming that the request has been accepted and that the customer will be contacted shortly to schedule the service.

Workflow Activation: The back-end automation trigger was successfully mapped to the Vehicle Service Request form's submission event without any compilation or system errors.

Script Validation: The written Deluge code passed Zoho Creator's logical syntax checks and successfully saved to the application architecture.

Live Execution Verification

- Filling out and submitting the live user form correctly generated a new record database entry.
- The backend script triggered instantaneously upon form submission.
- A real-time, automated confirmation email titled "Your Vehicle Service Request is Accepted" was successfully routed and delivered to the registered customer email address.

Result

The successful execution of this project conclusively demonstrates the power of low-code automation and multi-service architecture within the cloud ecosystem. By designing a targeted backend workflow, utilizing advanced Deluge scripting syntax, and establishing secure API-driven email notifications, the Vehicle Service Request application has transitioned from a passive data repository into an active, intelligent management system.
